

Gonorrhoea Transmission Risk by Gender

Saskatoon Health Region, 2016

Highlights

- New sexual partners, and multiple partners are leading transmission risks associated with gonorrhoea among females and males (*Figures 1 and 2*).
- Partners who met through the Internet are reported more frequently among males with gonorrhoea than females (*not shown*).
- Risks reported here are life-time STI risks and not necessarily associated with a 2016 infection. See [About the Data](#).
