

Self-Rated Mental Health

Why Is This Important?

Self-rated mental health is a person's state of psychological well-being as reported by that person. Good mental health is more than the absence of mental illness, but also the presence of factors such as ability to enjoy life, balance, and flexibility. Poor self-rated mental health is associated with poor [self-rated health](#), physical and mental illness, and increased health care service use. Higher income and more education are linked to better self-rated mental health.

What Is Being Done?

[Saskatchewan 211](#) provides access to mental health services and supports.

Highlights

A majority of the Region's population rate their mental health favourably.

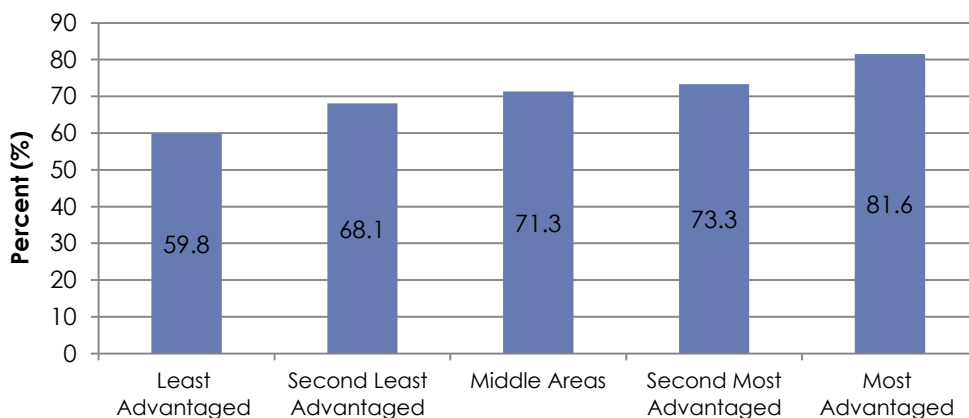

- More than seven in ten (72%) people reported their mental health as "very good" or "excellent" in 2013/14 (*Figure 1*). This is roughly equivalent to provincial and national rates. This means that almost 80,000 people in the Region do not rate their mental health this well.
- People living in the areas of least advantage in Saskatoon were significantly less likely to rate their mental health as "very good" or "excellent" compared to residents in areas of most advantage (59.8% compared to 81.6%; *Figure 2*).
- Self-rated mental health varies by [sub-group](#), including age, household income, areas of advantage, and education.
